Excerpt: . . . is better in winter than in summer. If the weight of air thrown into the f. jmace had been made the same in summer as in winter, by increasing the power of the blowing machine, and the area of the blast pipes, it is probable that the working would njt have been worse, in the former season t ran in the latter. An artificial heating of the blast should pro luce the same effects as that just alluded to, and it is by no means surprising that the efficacy of the hot blast has been doubted. It remains to be seen whence this eflieacj results. M. Dufrenoy has, in his explanation of the advantages of the hot air blast, shown die difference between the quantities of heat iutr. d iced into the furnace with the hot and old blasts, and in an assumed case has determined this difference to amount to about one-sixteenth of the heat evolved by the combustion of the fuel. Since less air i. s thrown into the furnace in using the hot blast, there is of course, on that account, less cooling effect to contend against than in the other case. M. Clc nent Desormes concluded by calculating from data in an assumed case, that the temperature within the furnace is increased between 270 and 330 Fab. by the heated air blast; an increase which he n. sid: rs arie juate to explain all the observed effects. These theories are...
